

# Nausea, Vomiting, Bowel Obstruction

Gordon J. Wood, MD, MSCI, FAAHPM  
Coleman Palliative Care Intensive  
February 13, 2015

# Objectives

- Describe a three step approach to the management of N/V at the end of life
- Identify strategies to manage refractory N/V in persons near the end of life
- Describe how to medically manage a malignant bowel obstruction

# Mechanism-Based Therapy

1. Careful assessment to determine etiology
2. Use knowledge of pathophysiology to determine receptors underlying symptoms
3. Choose antiemetic to block implicated receptors

# Mechanism-Based Therapy

1. Careful assessment to determine etiology
2. Use knowledge of pathophysiology to determine receptors underlying symptoms
3. Choose antiemetic to block implicated receptors

# Evaluation

- History
- Physical examination

*...think “Head-to-Toe”*

# Evaluation

- Laboratory Testing
  - What labs should you consider?
- Radiology
  - What imaging should you consider?

# Evaluation

- Confident in cause of N/V in 45 of 61 hospice patients
- Chemical abnormalities 33% (metabolic, drugs, infection)
- Impaired gastric emptying 44%
- Visceral and serosal causes 31% (bowel obstruction, GI bleed, enteritis, constipation)

# Evaluation

- 40 patient episodes of nausea and/or vomiting on inpatient palliative care unit
- 59 reversible etiologies
  - 51% medications
  - 11% constipation

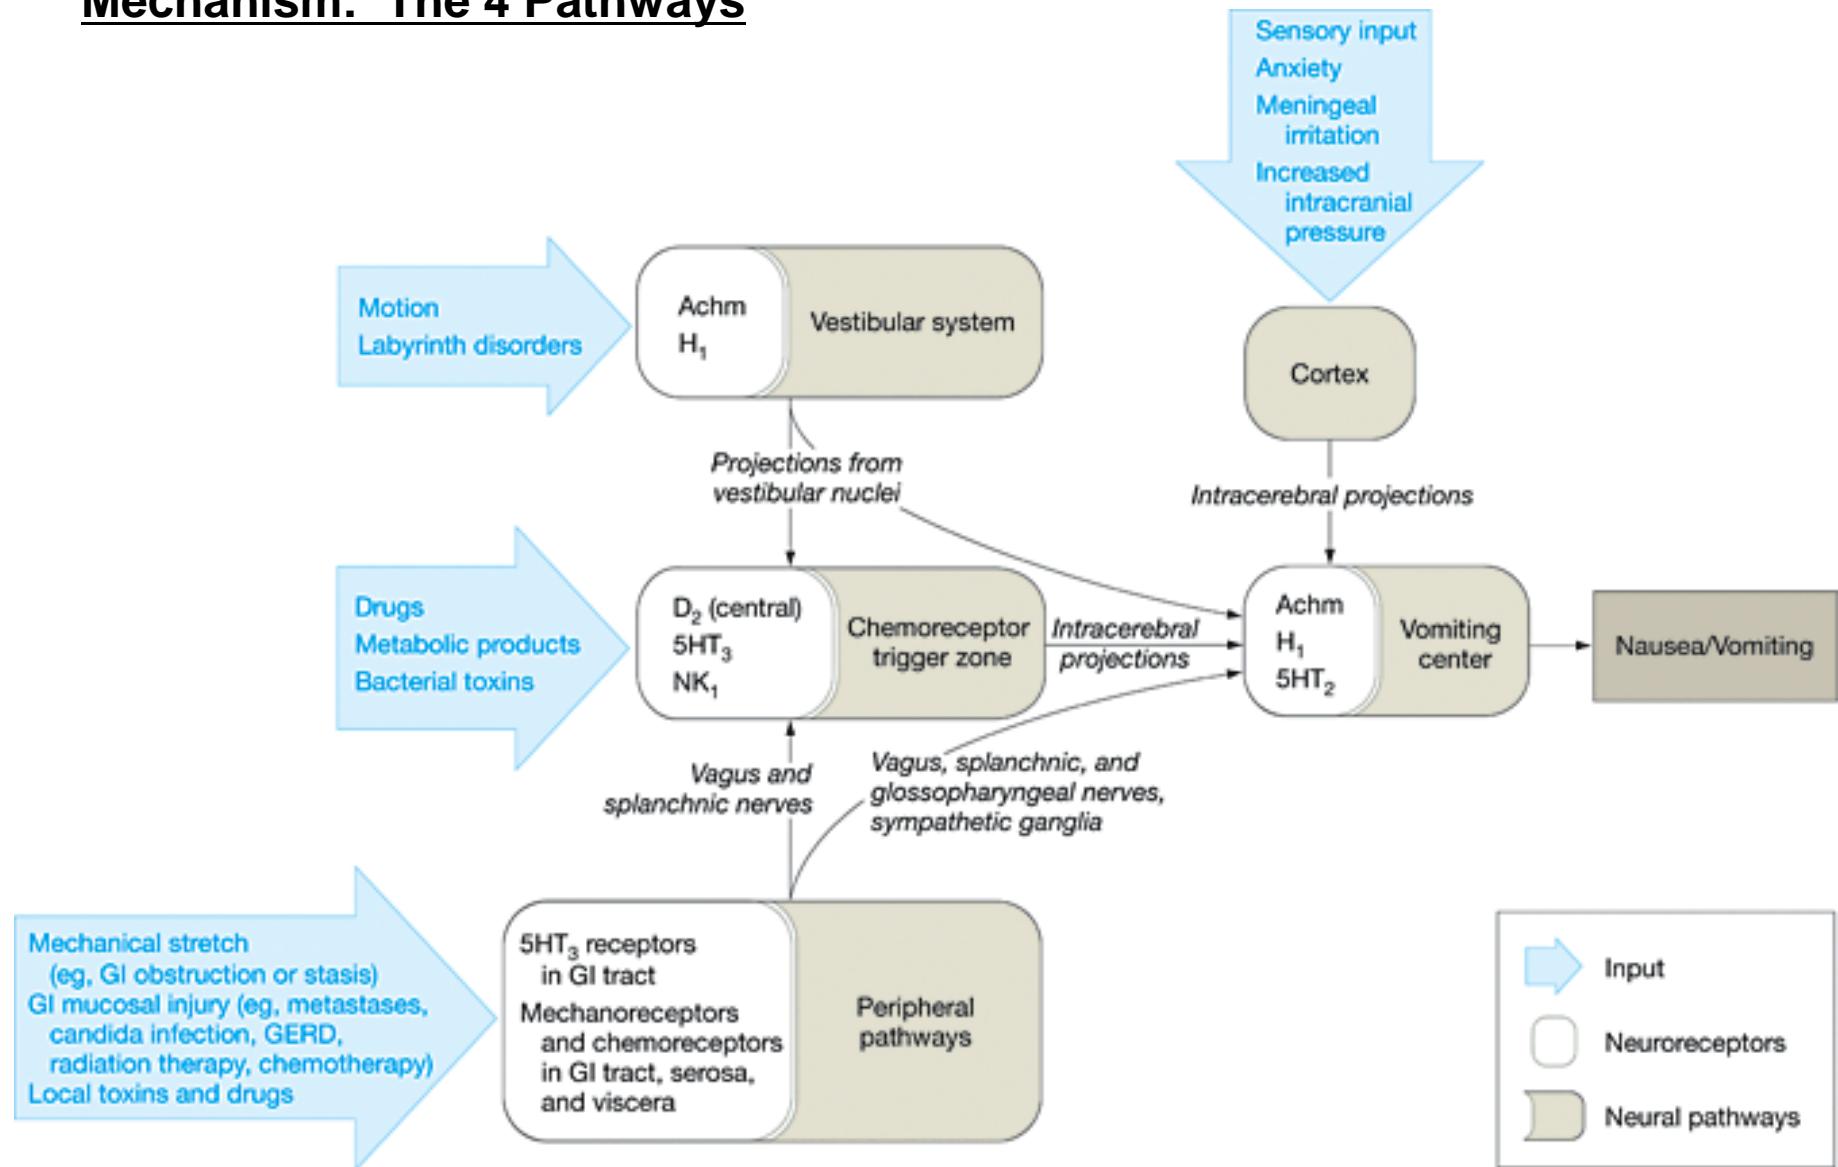

# Mechanism-Based Therapy

1. Careful assessment to determine etiology
2. Use knowledge of pathophysiology to determine receptors underlying symptoms
3. Choose antiemetic to block implicated receptors

# Mechanism: The 4 Pathways

1. Chemoreceptor Trigger Zone
2. Cortex
3. Peripheral Pathways
4. Vestibular System

# Mechanism: The 4 Pathways

Anxiety  
Meningitis  
Imitation  
Increased  
intracranial  
pressure

Coma

Intracerebral  
hemorrhage

Achm  
 $H_1$   
 $SHT_2$

Motion  
Labyrinth disorders

Achm  
 $H_1$

Vestibular system

Projections from  
vestibular nuclei

Drugs  
Metabolic products  
Bacterial toxins

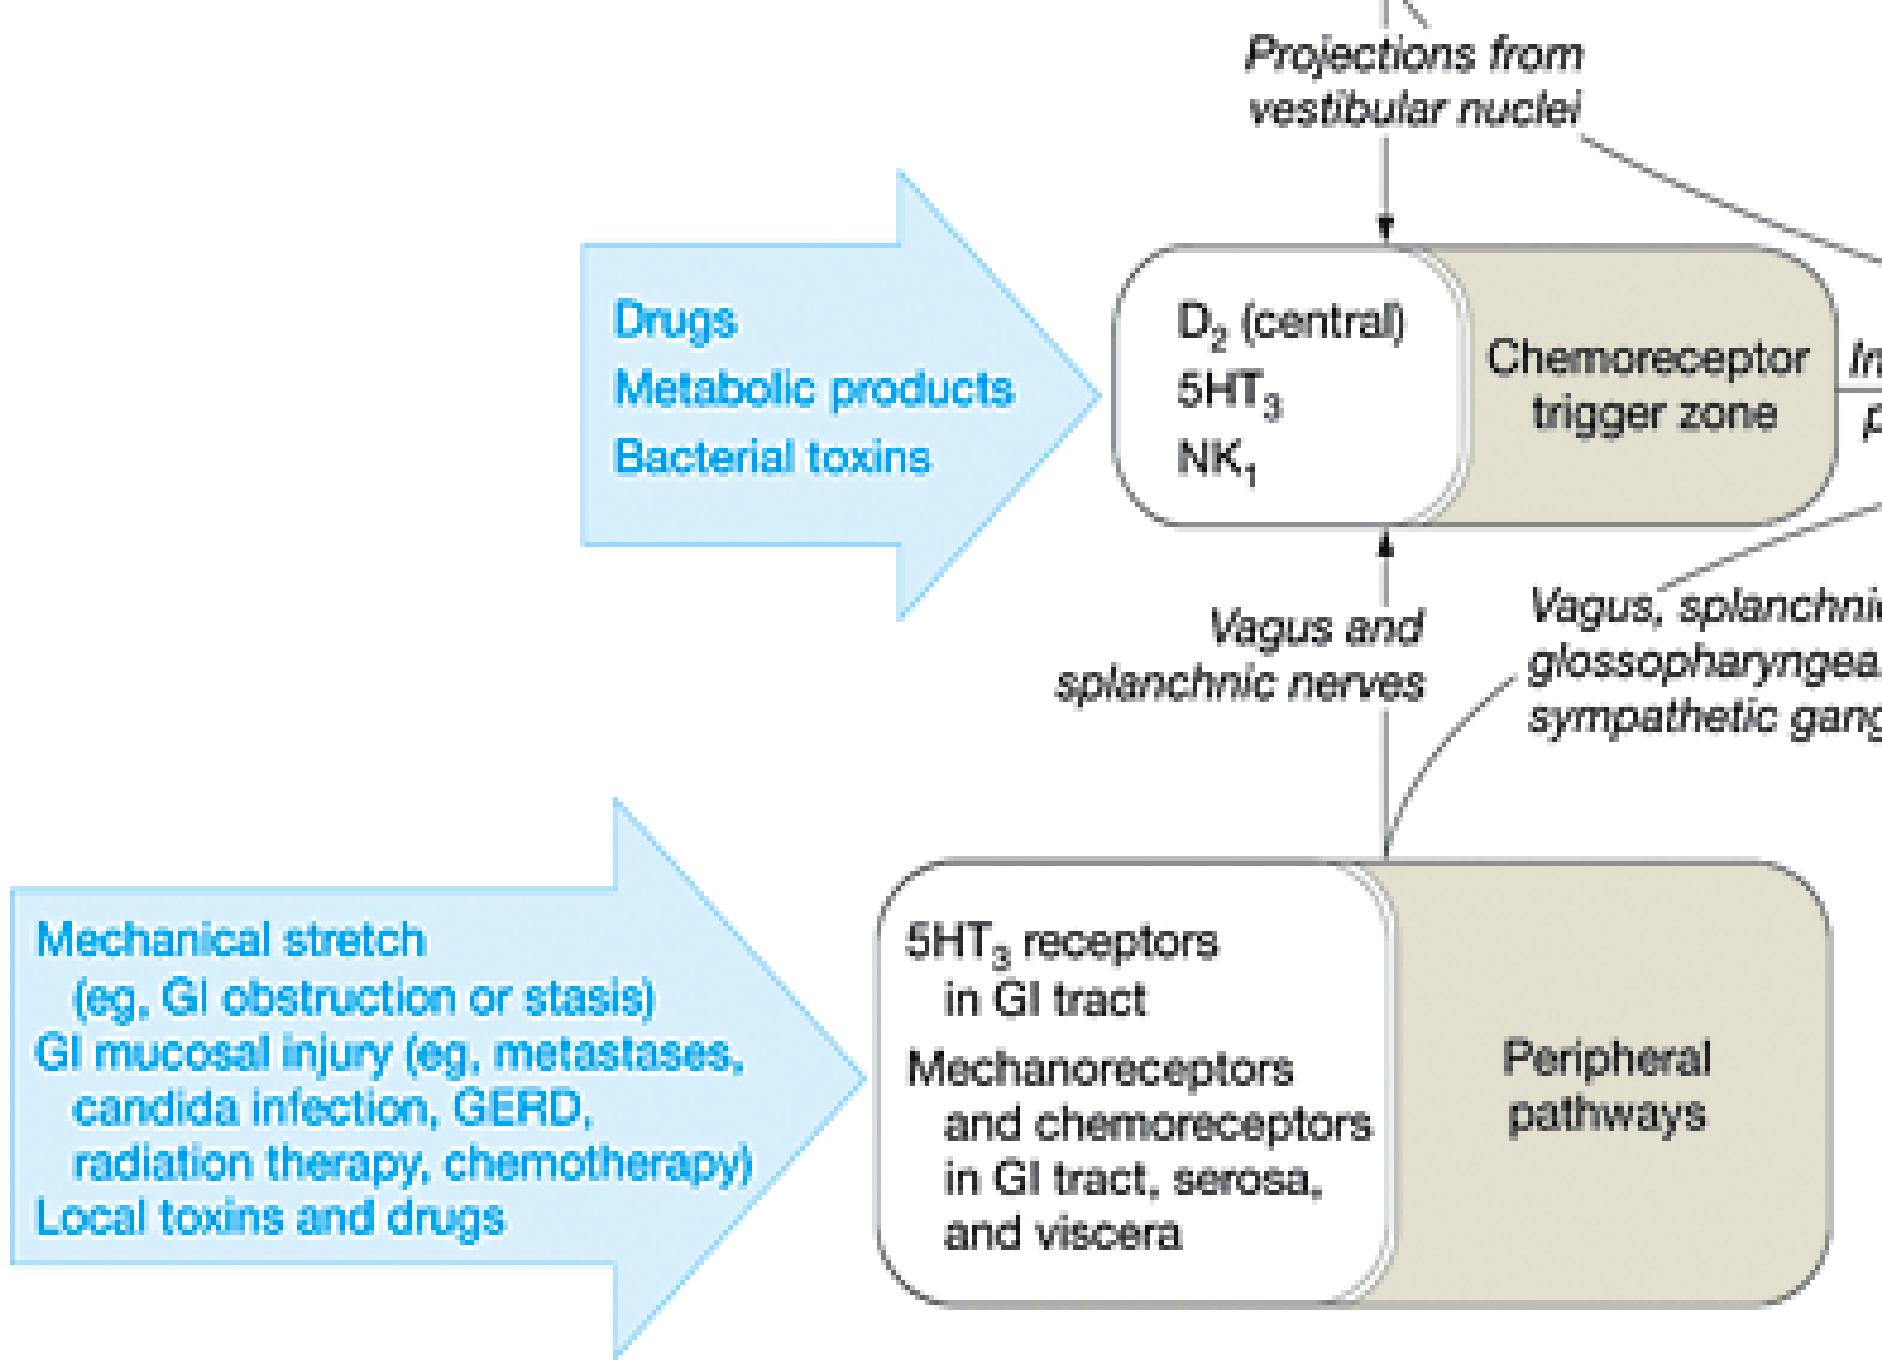

$D_2$  (central)  
 $SHT_3$   
 $NK_1$

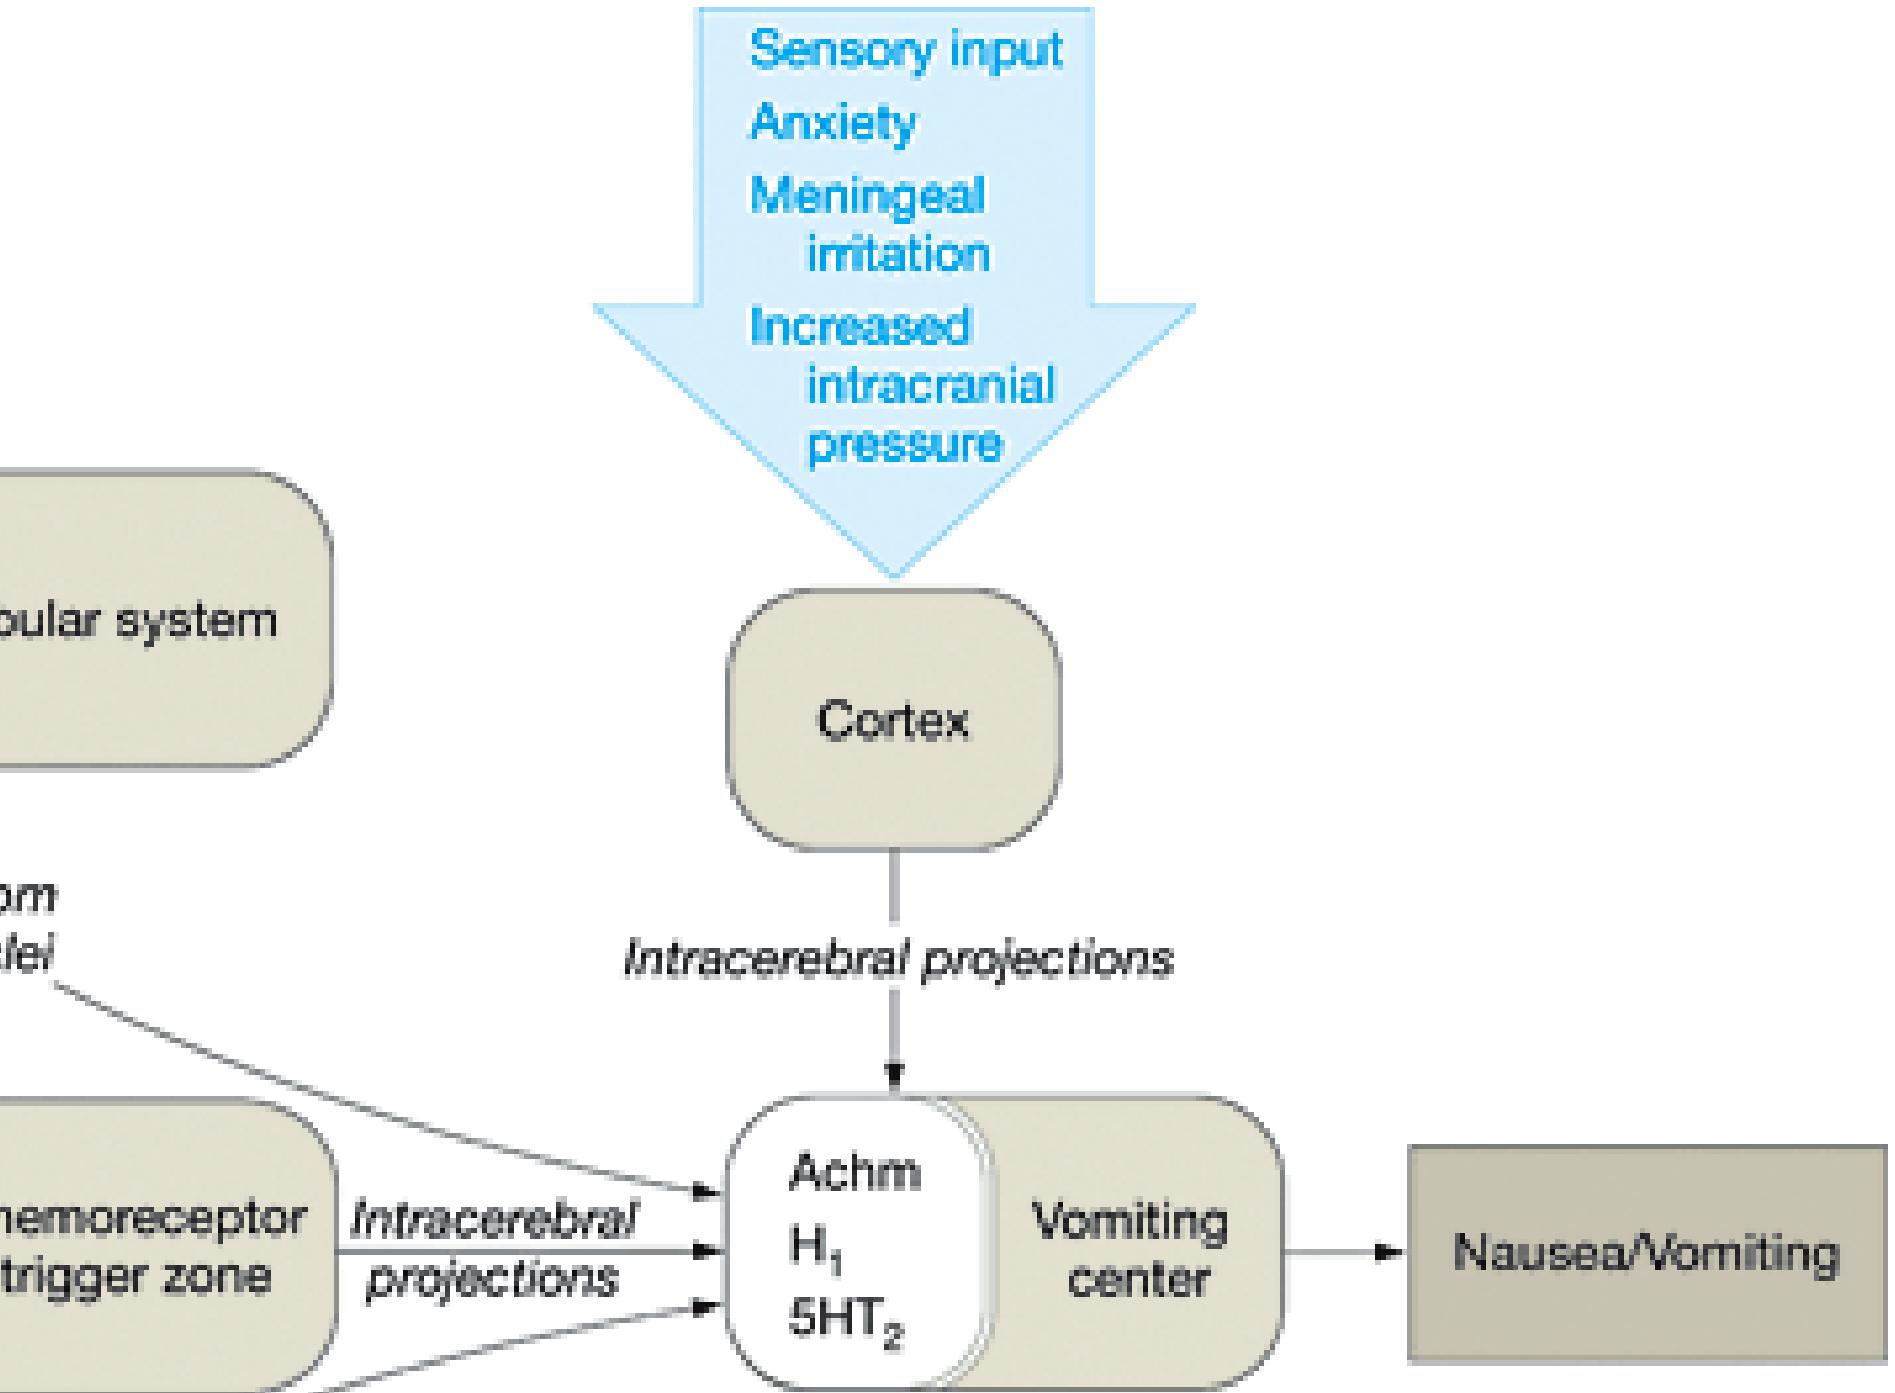

Chemoreceptor  
trigger zone

Intracerebral  
projections

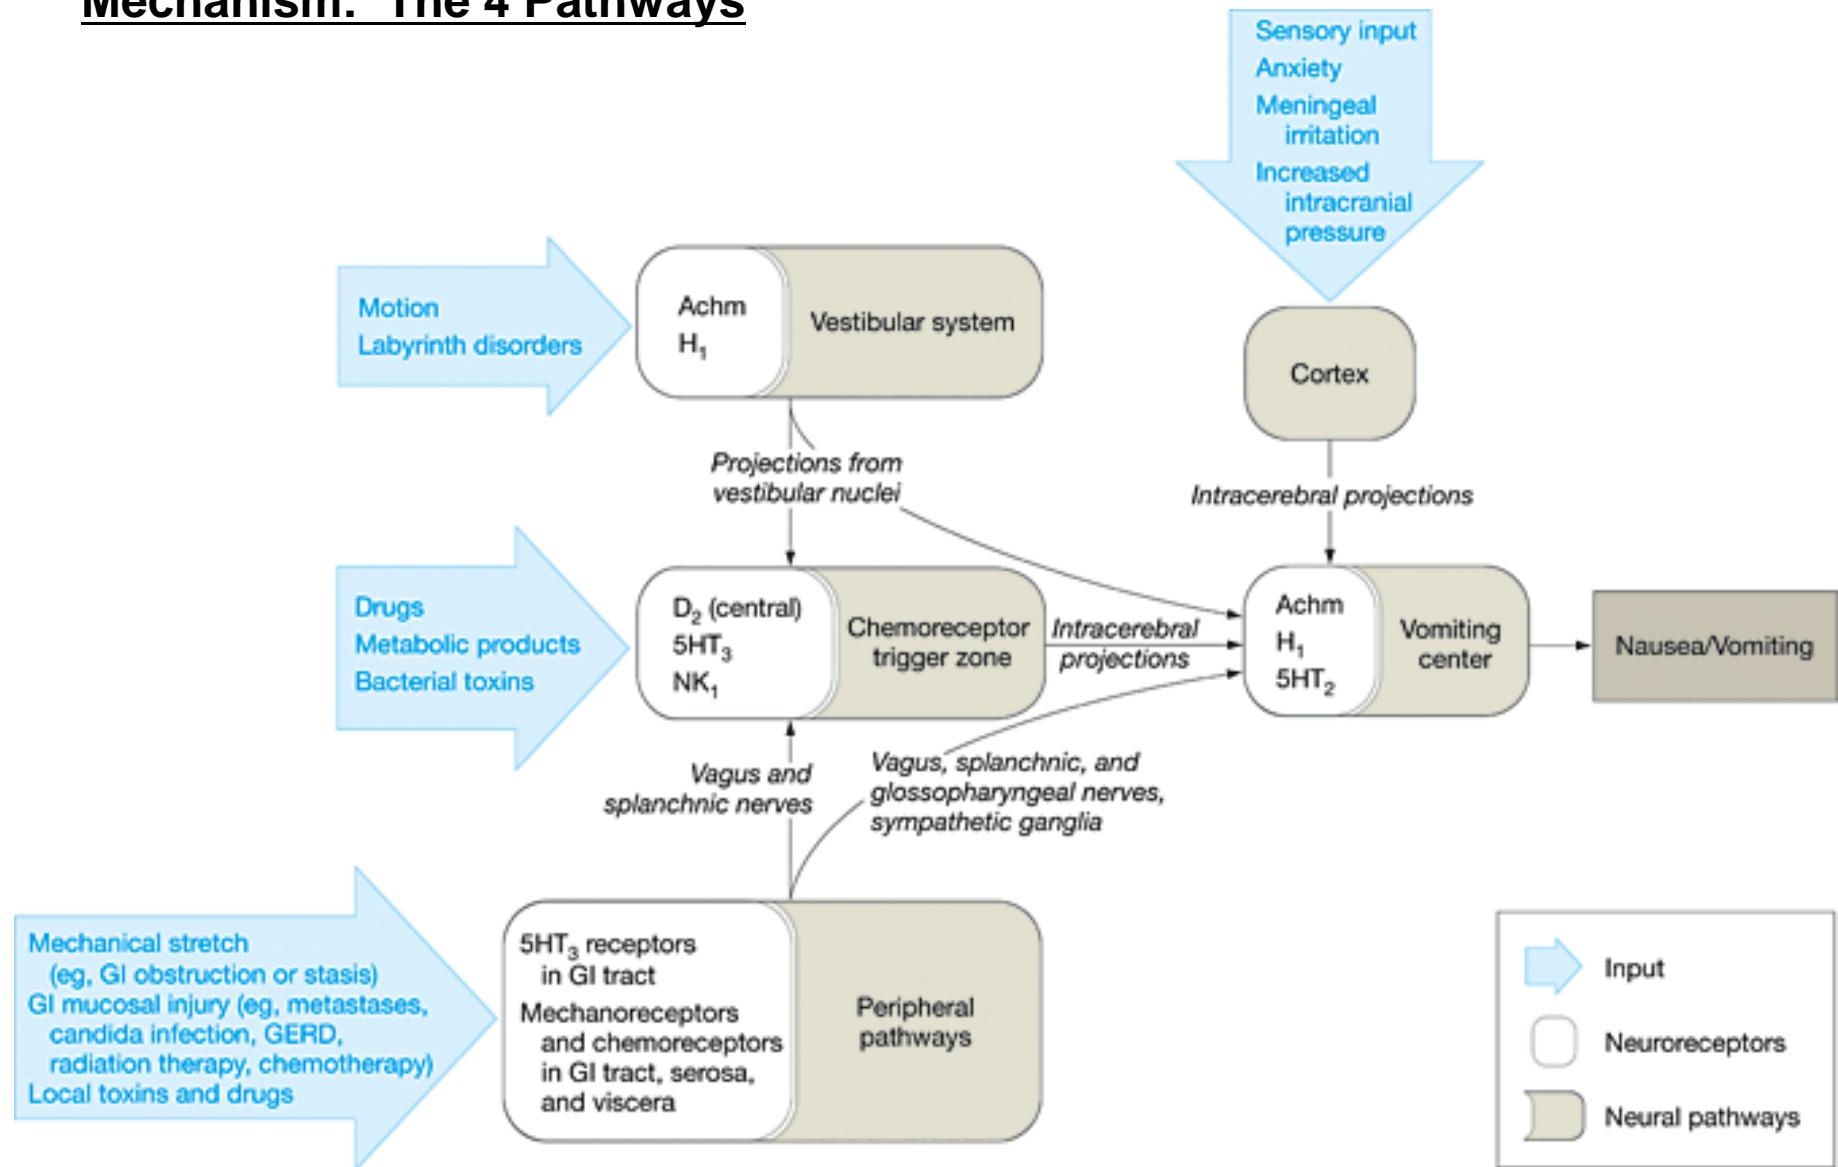

Vagus and  
splanchnic nerves

Vagus, splanchnic, and  
glossopharyngeal nerves,  
sympathetic ganglia

# Mechanism: The 4 Pathways

# Mechanism-Based Therapy

1. Careful assessment to determine etiology
2. Use knowledge of pathophysiology to determine receptors underlying symptoms
3. Choose antiemetic to block implicated receptors

# Antiemetics

Antiemetic	Receptor Anatagonized
Metoclopramide (Reglan)	?
Haloperidol (Haldol)	?
Prochlorperazine (Compazine)	?
Chlorpromazine (Thorazine)	?
Promethazine (Phenergan)	?

# Antiemetics: Continued

Antiemetic	Receptor Anatagonized
Diphenhydramine (Benadryl)	?
Scopolamine (Transderm Scop)	?
Hyoscyamine (Levsin)	?
Ondansetron (Zofran)	?
Mirtazapine (Remeron)	?

# Mechanism-Based Therapy

- 40 patient episodes of N/V in inpatient palliative care unit
- Most common causes: gastric stasis/outlet obstruction (35%), chemical/metabolic (30%)
- Nausea resolved in 28 of 34 cases (82%)
- Vomiting resolved in 26 of 31 cases (84%)
- Total symptom control in mean of 3.4 days

# Empiric Treatment

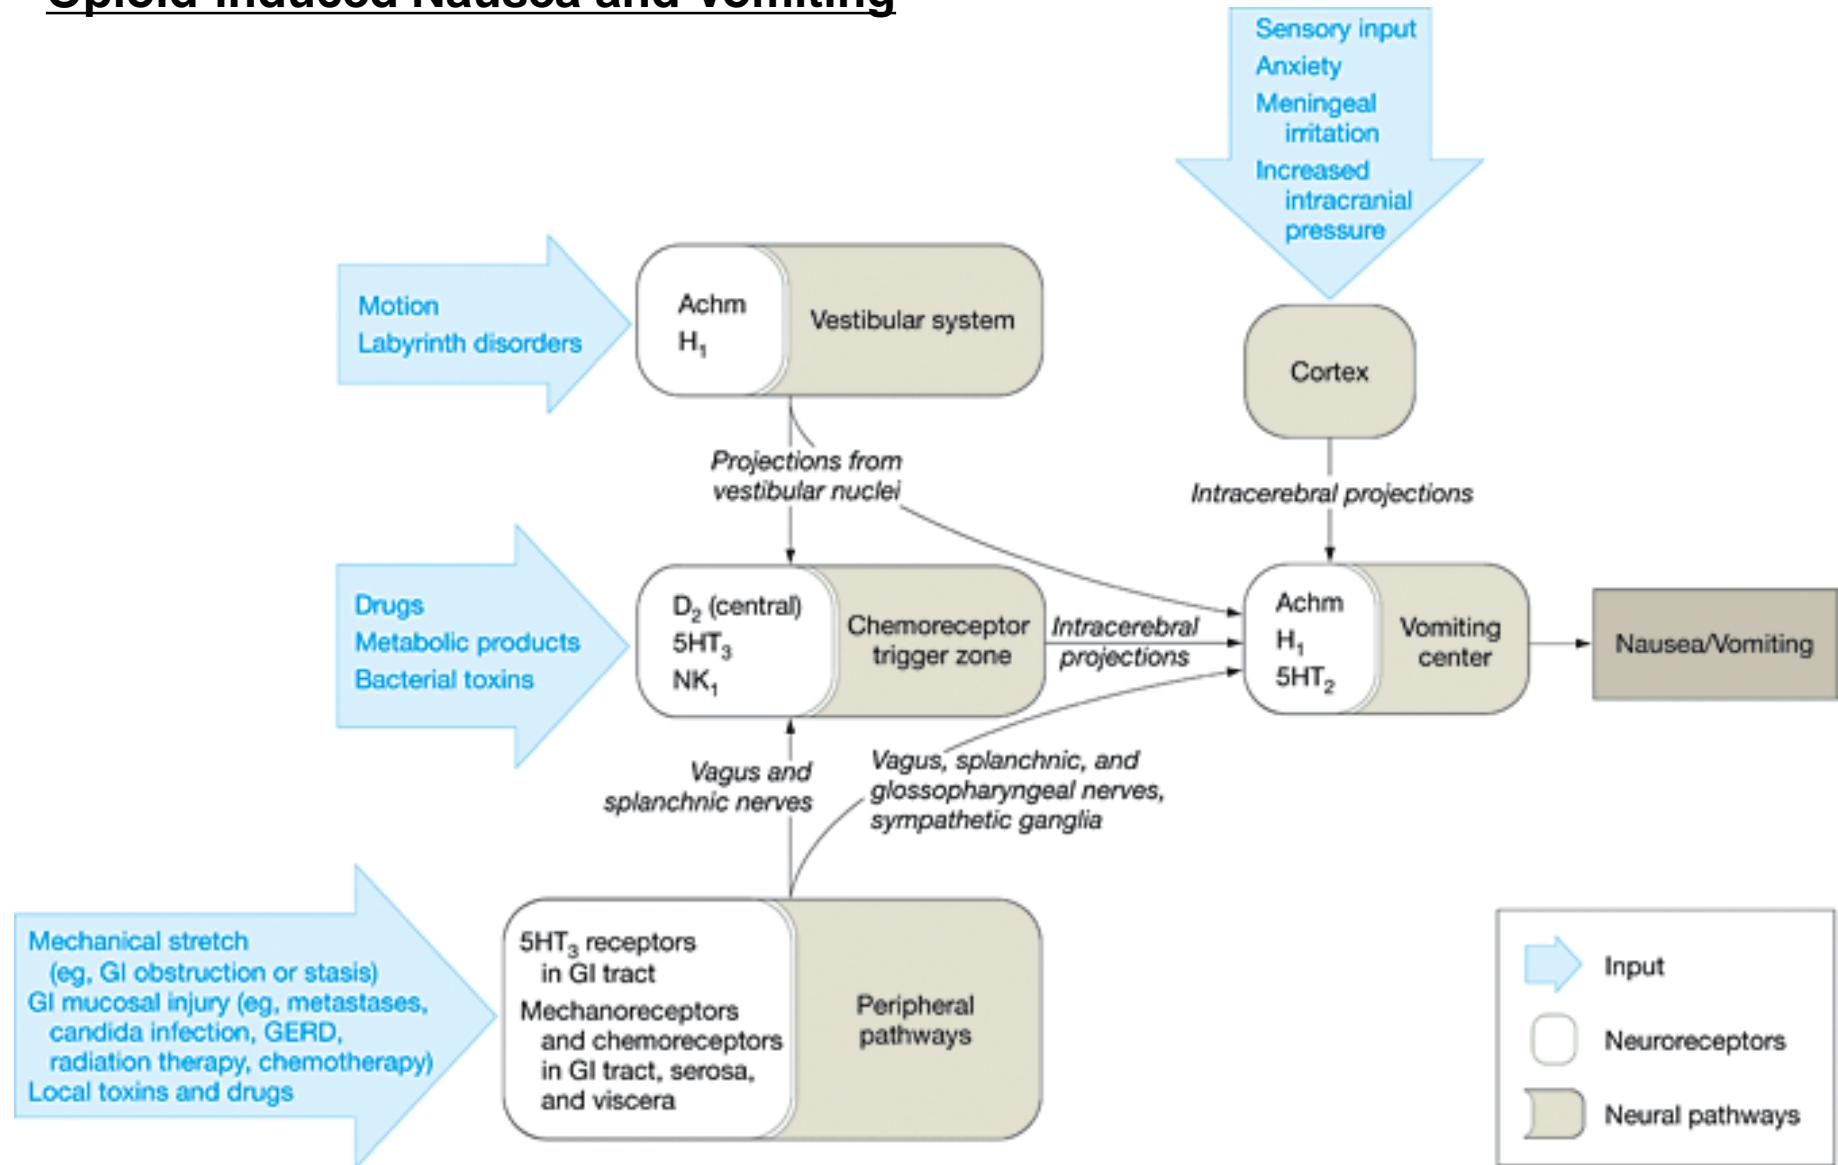

- Mechanism-based therapy effective<sup>1,2</sup>
- Some advocate empiric D2 antagonists<sup>3</sup> in all cases
- No head-to-head comparison
- D2 antagonists are our first choice in acutely symptomatic patients undergoing workup

3. Bruera E et al. J Pain Symptom Manage. 1996;11(3):147-153.

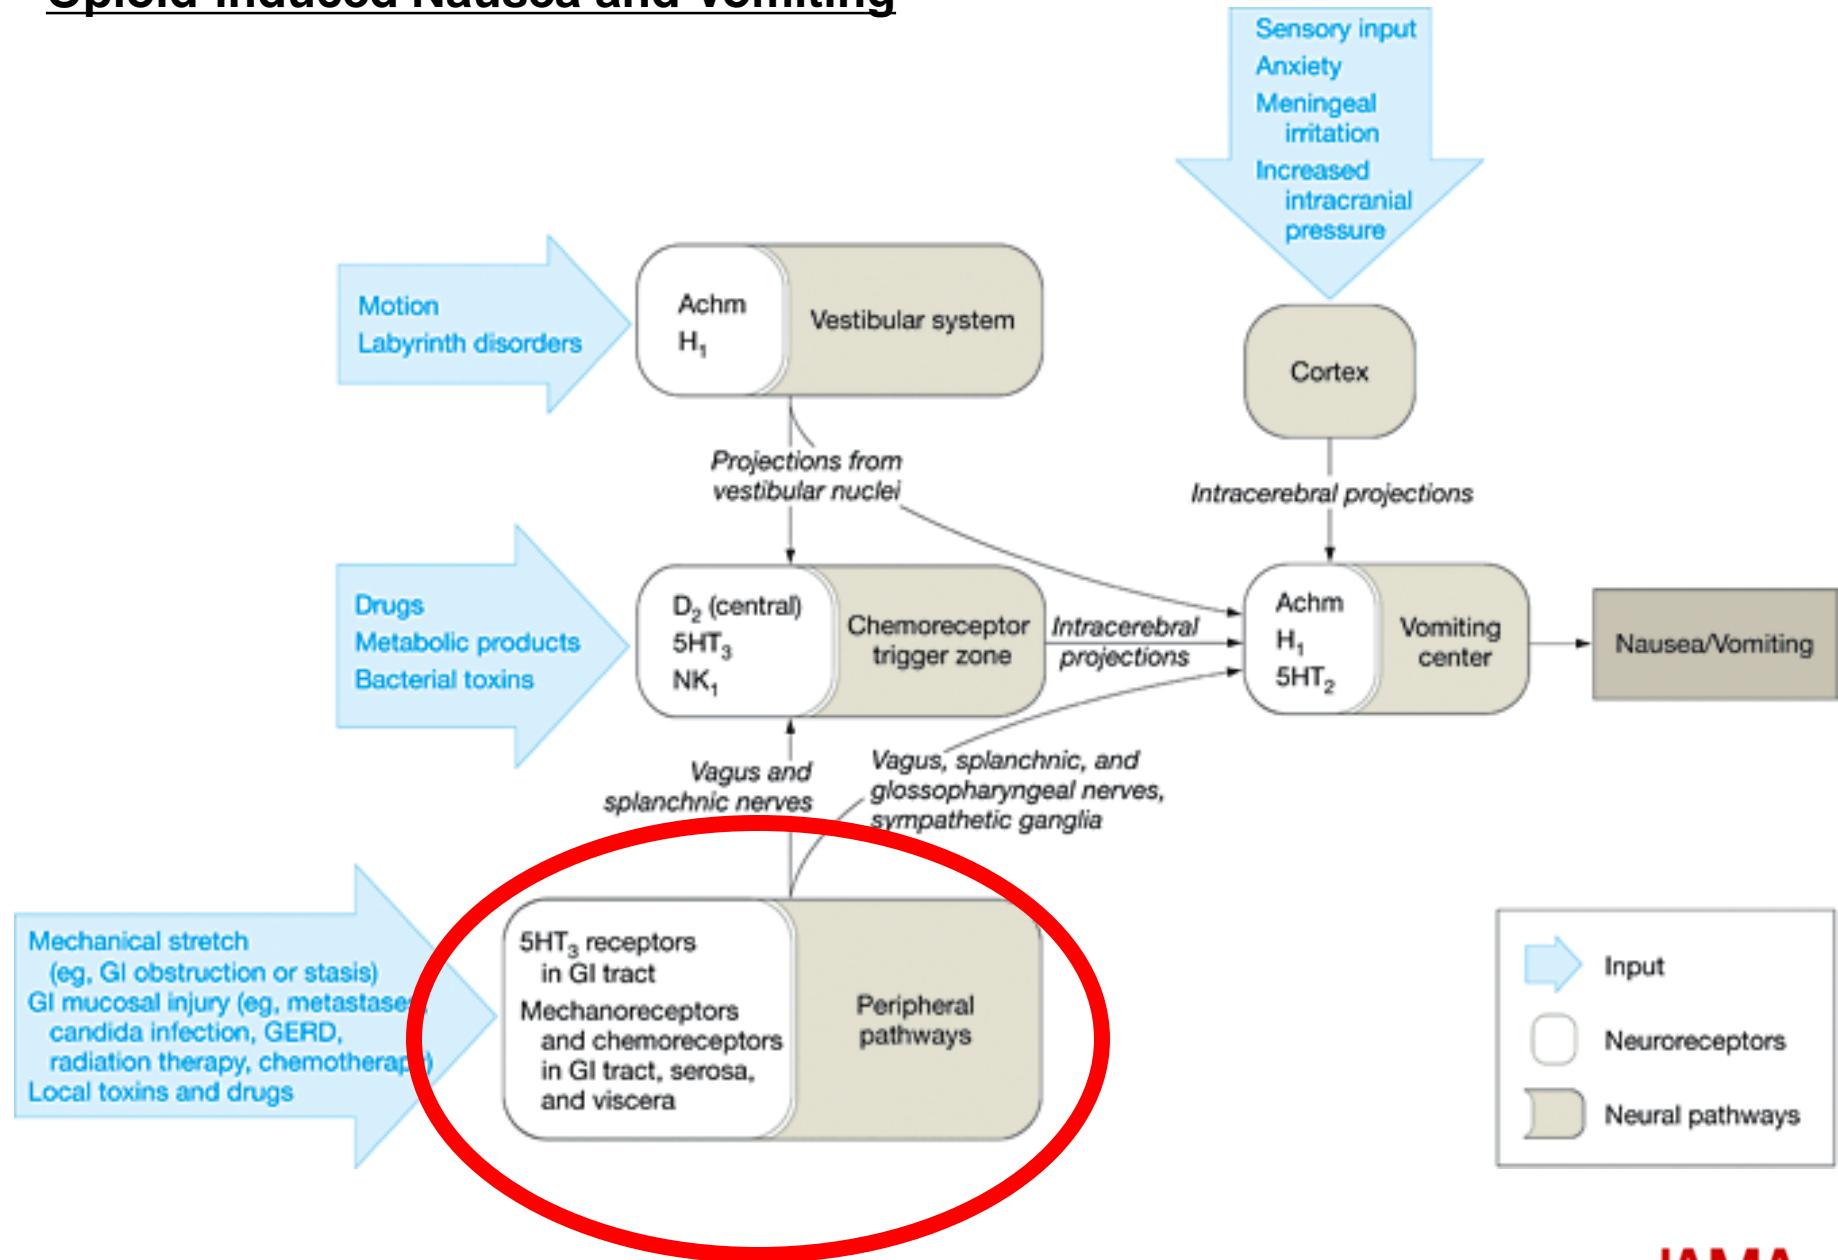

# Benefits of mechanism-based therapy

- Potentially more effective in certain scenarios
- Facilitates systematic approach that identifies all possible contributors
- Guides treatment of underlying causes
- Informs choices of second and third antiemetics
- Minimizes risks of side-effects

Metoclopramide  
Haloperidol  
Prochlorperazine

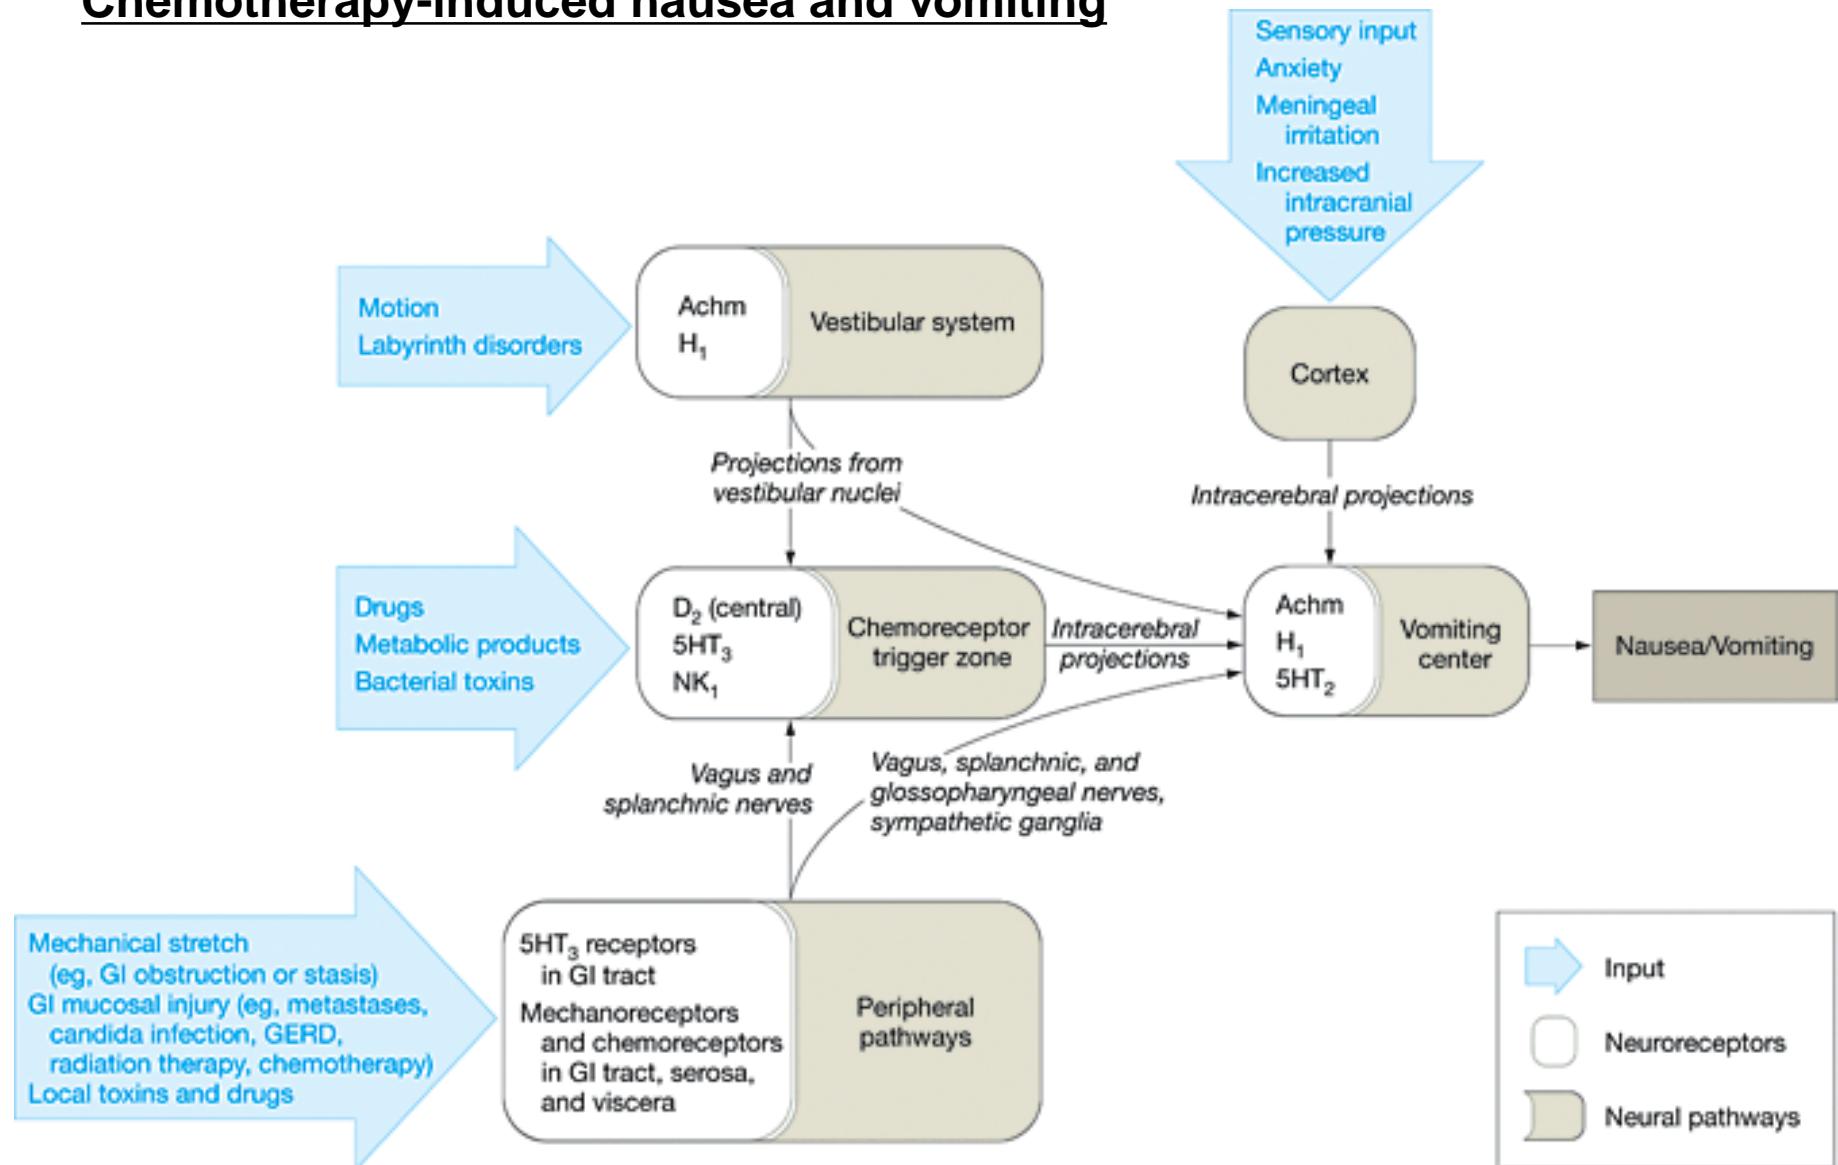

# Opioid-Induced N/V

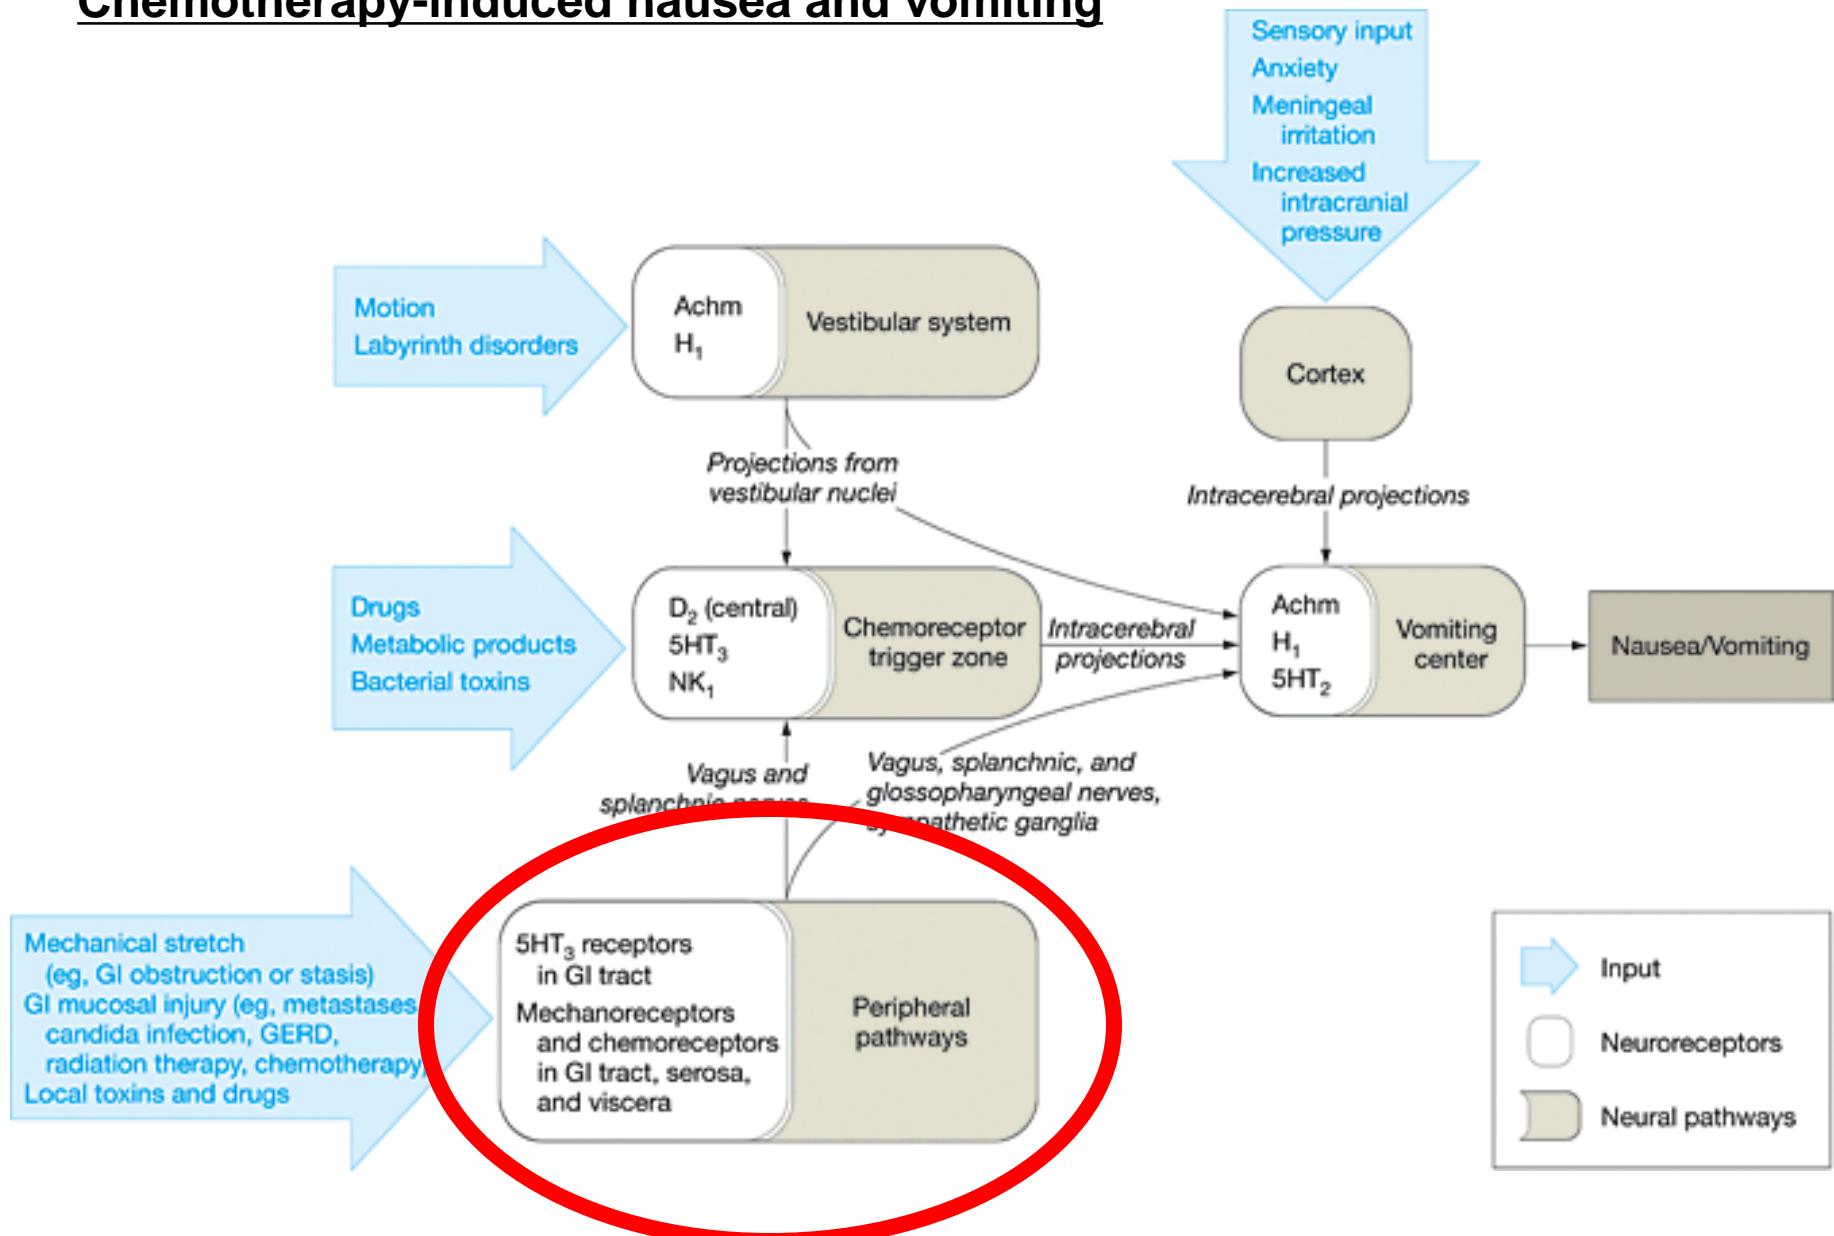

- D2 antagonists first-line
- Generally resolves within 3-5 days of continued use
- 10-20% dose reduction may alleviate nausea without loss of analgesia<sup>1</sup>
- Opioid rotation also effective<sup>2</sup>

JAMA

# Malignant Bowel Obstruction

Metoclopramide  
Haloperidol  
Dexamethasone

# Malignant Bowel Obstruction

- Most common in ovarian, colorectal CA
- Interventional management
  - Surgery if prognosis > 2 mos
  - Stent, NG tubes, venting PEG tubes
- Medical Management
  - Analgesic: opioid
  - Antisecretory: Octreotide/anticholinergic
  - Antiemetic: Metoclopramide/haloperidol
  - Steroid: Dexamethasone

# Nonpharmacological Therapy

- Avoid strong smells or other triggers
- Small, frequent meals
- Limit oral intake during severe episodes
- Relaxation techniques
- Acupuncture and acupressure (P6 stimulation)<sup>1</sup>

1. Vickers AJ. J R Soc Med. 1996;89(6):303-311.

# Refractory/Intractable N/V

# Refractory/Intractable N/V

- Schedule around-the-clock
- Add second agent to block other implicated receptors
- Prophylactic dosing
- Treat underlying cause if possible

# Refractory/Intractable N/V

- Less traditional agents
  - Dexamethasone (Decadron)
  - Mirtazapine (Remeron)
  - Dronabinol (Marinol)
  - Olanzapine (Zyprexa)
  - Megestrol (Megace)
  - Thalidomide (Thalomid)

# 5HT3 Antagonists

- Effective for:
  - Chemotherapy-induced N/V<sup>1</sup>
  - Radiation therapy-induced N/V<sup>2</sup>
  - Post-operative N/V<sup>3</sup>
  - Smaller studies suggest efficacy for nausea due to opioids<sup>4</sup> or uremia<sup>5</sup>
- Otherwise, no more effective than cheaper D2 antagonists for most common causes of N/V<sup>6</sup>

# Polypharmacy

- Most anti-emetics are centrally active
- Mechanism-based therapy prevents use of multiple medications antagonizing same receptor

# Conclusions

1. Mechanism-based approach
  - Careful assessment to determine etiology
  - Use knowledge of pathophysiology to determine receptors underlying symptoms
  - Choose antiemetic to block implicated receptors
  - Also treat underlying etiology
2. Refractory/Intractable N/V
  - Multiple agents, around-the-clock and prophylactically
  - Less traditional agents
